Mobile App. Dev.

Postmortem

During the semester we worked with Android Studio to make a working application. We decided to make a recipe app that would allow users to add recipes, delete recipes, change the serving size, and convert recipes into different measurements. It would also enable users to upload a recipe through the camera, share with Facebook and access Food.com to look for a new recipe of their choice. The app would also have the ability to sync recipes between users' devices. Throughout the course we mostly stayed with our simple, yet sleek design. We have a neutral color scheme which should attract men and women, with a simple drop down menu from which to choose a category such as Breakfast, Lunch, Dinner, Desert, Drinks.

As we worked on this project we were able to have add, delete, serving size change, and conversion working. Although only showing delete when you were on a recipe was a little difficult, we finally got it. Some things that we wish we could have finished are the ability to save a recipe through the camera, the ability to access Food.com for new recipes, and the ability to share recipes through Facebook. We also didn't have enough time to start on a sync solution for the app to sync recipes between users' devices.
